

Eliminate Costly Sensor Installation Errors

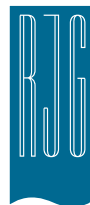

RJG's Flush Mount Sensor Installation/Check Kit contains the tools and documentation to install and check dimensions of the pockets for 4mm Piezoelectric Flush Mount style cavity pressure sensors. Sensor accuracy is dependent on proper installation of the sensor. If a sensor doesn't fit correctly or the bore is not concentric it can cause preload on the sensor and inaccurate readings.

Included with the kit are a 4mm pocket form tool for drilling all three critical dimensions of the sensor pocket in one pass, a retaining nut thread tap, a 4mm Go No-Go gage for instantly checking the pocket, and a concentricity checker and test block to verify dimensions.

Who would benefit from using The Lynx Flush Mount Sensor Installation Kit? Tool shops benefit by ensuring sensors are functioning prior to the mold being shipped to the customer. Tool rooms can prevent sending molds with improperly installed sensors into production, and mold setters can do that last quick check prior to hanging the mold.

Features and Benefits

- All critical tools included
- Easy to understand instructions
- Simple to use
